CAP776: PROGRAMMING IN PYTHON

MINOR PROJECT #1 REPORT

MY DATA, MY STORY

Personal Activity Intelligence Report

Student Details	Info
Student Name	Aloukik Shukla
Registration / Roll No.	12607191\B63
Program / Section	Python\D1P2635
Activity Recording Period	13 August 2026 to
Date of Report Generation	27/09/2026

1. Activity Data Summary

Particular	Value
Expected number of days	36
Valid days recorded	41
Missing days	-5
Invalid / excluded records	-5
Average Sleep/day	427.00 min/day
Average Fitness/day	18.66 min/day
Average Study/day	118.29min /day
Average Coding/day	22.44 min / day
Average Class/day	237.93 min / day
Average Other Activities/day	41.02 min / day
Average Free / Unaccounted Time/day	574.66 min / day

2. Index Values

Enter the final value generated by your Python program. The activity indicators are based on simple averages across valid recorded days. PAI is calculated using the predefined weights shown below.

Index Name	Acronym	Formula	Value to Enter
Personal Activity Index	**PAI**	**PAI =** 0.15(TPI) + 0.20(AAI) + 0.15(PhAI) + 0.20(SRI) + 0.15(TUI) + 0.10(EI) + 0.05(DCI)	298.54 min / day
Tech Productivity	**TPI**	**TPI =** Average(Coding Time per valid recorded day)	22.44 min / day
Academic Activity	**AAI**	**AAI =** Average(Study Time + Class Time per valid recorded day)	356.22 min / day
Physical Activity	**PhAI**	**PhAI =** Average(Fitness Time per valid recorded day)	18.66 min / day
Sleep & Recovery	**SRI**	**SRI =** Average(Sleep Time per valid recorded day)	427.00 min/day
Activity Balance	**ABI**	**ABI =** Average(Free / Unaccounted Time per valid recorded day)	574.66 min/day
Time Utilization	**TUI**	**TUI =** Average(Total Tracked Time per valid recorded day)	865.34mmin/day
Experience Index	**EI**	**EI =** Average of daily (Feeling Score + Satisfaction Score + Energy Score) / 3	2.35 / 5
Data Continuity Index	**DCI**	**DCI =** (Valid Recorded Days / Expected Days) × 100	113.89 %

Formula references: All time values are taken directly from the activity record and averaged across valid recorded days. Feeling, Satisfaction and Energy are scored using the prescribed 5/4/3/2/1, 5/4/3/2/1 and 3/2/1 scales respectively. PAI uses the predefined weights shown above. DCI rewards complete and continuous recording from 13 August 2026.

3. Key Findings from My Data

No.	Correlation/Observation	Evidence from my data
1	Sleep ↔ Energy	Average sleep was 427 min/day (7 h 7 min). The report gives an overall Energy component within EI, but daily sleep-energy values are not provided, so a direct correlation cannot be confirmed.
2	Study ↔ Satisfaction	Average study time was 118.29 min/day. The overall Experience Index was 2.35/5; daily study-satisfaction values are not provided, so a direct correlation cannot be confirmed.
3	Coding ↔ Energy	Average coding time was 22.44 min/day. The overall Experience Index was 2.35/5; daily coding-energy values are not provided, so a direct

		correlation cannot be confirmed.
4	Academic Activity	Study + class activity averaged 356.22 min/day, showing that academic activities formed a substantial part of tracked time.
5	Time Balance	Tracked time averaged 865.34 min/day, while free/unaccounted time averaged 574.66 min/day, leaving scope for better time utilization.

4. Findings About Myself (100–200 words)

Write about what your activity data revealed about your habits, priorities, consistency, balance, academic/technical engagement, and the relationship between activities and your reported experience.

My activity data shows that academics were a major part of my recorded routine. Study averaged 118.29 minutes per day and class time averaged 237.93 minutes, giving an Academic Activity average of 356.22 minutes per day. Sleep averaged 427 minutes (about 7 hours 7 minutes) per day, while fitness averaged only 18.66 minutes and coding averaged 22.44 minutes per day. This indicates that my academic engagement is stronger than my technical practice and physical activity. The data also shows 574.66 minutes of free or unaccounted time per day, which is a large portion of the day that could be planned more effectively. My Experience Index is 2.35/5, suggesting that there is room to improve my overall daily experience. The Data Continuity Index shown in the report is 113.89%, although this is above 100% because the recorded valid days (41) exceed the expected days (36). Overall, the data highlights a need for better balance, consistency, and purposeful use of time.

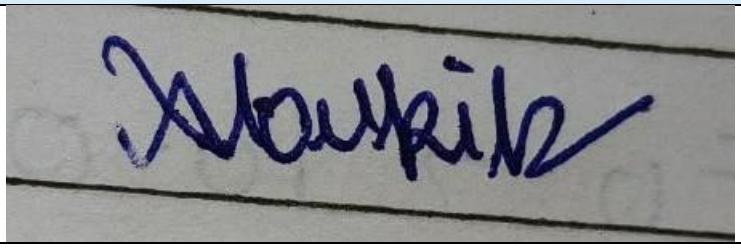

5. Areas and Ways to Improve My Lifestyle (100–200 words)

Identify the areas you would like to improve and describe specific, realistic ways in which you intend to improve them based on the evidence from your data.

I would like to improve three main areas: coding practice, physical activity, and the use of free time. My coding average is only 22.44 minutes per day, so I can increase it gradually by setting aside at least 30–45 minutes for Python practice on study days and solving small programming problems regularly. Fitness averages 18.66 minutes per day, so I can make physical activity more consistent by following a short daily workout or brisk walk. The largest opportunity is free or unaccounted time, which averages 574.66 minutes per day. I can reduce unplanned time by preparing a simple daily schedule with fixed blocks for study, coding, exercise, meals, and rest. My study and class activity is already relatively strong, so the goal is not simply to study longer but to use the available time more purposefully. I will also monitor my sleep and daily experience scores so that future activity records can show whether these changes improve my balance, energy, and satisfaction.

6. Student Declaration

I confirm that the values entered in this report have been generated from my submitted activity data using my Python program and that the report represents my own analysis.
